Gateway to Excellence

April 1, 2008

Dear Parent/Guardian:

All schools in Washington are required to provide information on meningococcal disease to parents or guardians of students entering Grades 6-12.

Meningococcal disease is a serious infection of the brain (meningitis) and blood caused by a type of bacteria. Fortunately, this life-threatening infection is rare -- only about 75 people are infected each year in Washington. Adolescents and young adults are more likely to get meningococcal disease, especially those living in group settings, like college dorms.

A vaccine is available that can protect your child against the most common types of bacteria that cause meningococcal disease. One dose of meningococcal vaccine is recommended for adolescents ages 11-12 years as part of their pre-teen health check-up. The vaccine is also recommended for adolescents ages 13 through 18 who have not previously been vaccinated. College students living in dorms are at increased risk for meningococcal disease and should get vaccinated before starting college if they have not been previously vaccinated. The meningococcal vaccine is not required for school attendance.

Here are some other ways to prevent the spread of meningococcal disease:

- Practice good hygiene (regular hand washing, covering coughs and sneezes, etc.)
- Do not share personal items such as eating utensils, glasses, cups, water bottles, drinks, lip gloss or toothbrushes, because they may spread meningococcal disease as well as other bacteria and viruses.

We encourage you to learn more about meningococcal disease and how to prevent it. More information on meningococcal disease, the vaccine, and other recommended immunizations is available on the following web sites:
